

## Section-4

### Assignment Operator, Variables and Strings

Write program for every problem in different file.

#### Problem-1:

Define 4 variables and assign different data type values like int, float, string and bool.

#### Problem-2:

Define a variable name **firstName** and assign your first name, define another variable your age and assign you current age. After that increment the value of **age** by 1.

#### Problem-3:

Define a variable and assign a string value to it. Do indexing to get every character from string and print it.

#### Problem-4:

Make a Program to find the circumference of circle ( $2 * \pi * r$ ).
