

Section-4

Boolean and Conditional Logic

Problem-1:

Write a program that takes two numbers from user, compare them and if they are equal then print "both numbers are equal" else "not equal".

(hint: user input function, convert the value into integer using int(), == for equality)

Problem-2:

(first make the above program)

Write a program that takes 2 numbers from user, compare them if first number is greater then other number print "number one is greater" else "number two is greater"

(hint: user this symbol >)

Problem-3:

Write a program that takes 3 numbers from user and then print the greater number?
